

**– TRACKING TAR SANDS CRUDES –**

**RESEARCH NOTE 1:**

**CANADIAN CRUDE OIL IMPORTS TO U.S. REFINERIES**

PREPARED BY MOREY BURNHAM, EARTHWORKS

APRIL 2010

## CANADIAN HEAVY CRUDE EXPORTS TO THE U.S. - 2009

In 2009, there were 53 refineries that did not receive any Canadian crude oil imports (either tar sands or conventional crude), and 71 refineries that did receive Canadian crude oil. Almost all of the refineries in Petroleum Administration Defense District (PADD) 2 and all of the refineries in PADD 4 import some Canadian crude – both heavy and light. The majority of the refineries that did not import Canadian crude in 2009 were located in PADD 1, PADD 3, and PADD 5.

In 2009, there were 43 refineries that reported receiving heavy Canadian crude oil imports (of all refineries reporting imports of crude oil). It is assumed that these refineries did receive Canadian tar sands crude, as tar sands crude is a heavy oil, and, as of 2006, tar sands crude accounted for 43% of crude oil production in Canada. In addition, tar sands production surpassed conventional oil production in the western Canadian provinces.

## REPORTING TAR SANDS IMPORTS

The U.S. Energy Information Administration (EIA) collects information on crude oil and other petroleum product imports to the United States. Monthly data are filed via form EIA-814 by each company that imports crude oil or petroleum products into the United States. This is a mandatory filing under *Public Law 93-275 (Federal Energy Administration Act of 1974)*, Sec. 13(b), 5(a), 5(b), 52.<sup>1</sup> Data from EIA-814 filings are available to the public, and are summarized in the EIA's "Company Level Import" reports.<sup>2</sup>

### USEFUL DATA IN FORM EIA-814:

- **products** (data can be sorted to differentiate imports of crude oil from imports of finished petroleum products such as jet fuel or petrochemicals)
- **country of origin** for imported crude oils
- **processing facility**, which, for crude oil is typically a refinery receiving the imported crude oil
- **API gravity**, which tells you about the weight of the crude, **and sulfur** content of the imported crude oils are also reported (it is possible to distinguish between heavy and light, and sweet and sour crude oils)

### LIMITATIONS OF THE DATA FILED IN FORM EIA-814:

- The form does not report the name of the crude oil, or the originating province of the crude oil. So it is not possible to trace a tar sands crude from Canada to a particular refinery. We have attempted to do so here based on API gravity and sulfur content, but this method has a number of challenges and limitations associated with it.
- Some crude oil shipments went to "unknown" processing facilities. It is not clear if the companies submitting the form simply did not fill out this part of the form.
- Shipments are reported on a **monthly** basis. There is no requirement to report separate "batches" or shipments of a particular type of crude (although it appears that some refineries do report this way). Therefore, if a refinery imports a number of different types of crude in a

---

<sup>1</sup> EIA web site. Forms. **See form EIA-814.** <http://www.eia.doe.gov/oss/forms.html>

<sup>2</sup> EIA web site. Company Level Imports. [http://www.eia.doe.gov/oil\\_gas/petroleum/data\\_publications/company\\_level\\_imports/cli.html](http://www.eia.doe.gov/oil_gas/petroleum/data_publications/company_level_imports/cli.html)

month (e.g., heavy, light, synthetic) they may simply report one number for the volume of crude oil imported (and average the API and sulfur values for all of the shipments in a month). This makes it impossible to identify any one crude oil.

## RESULTS

The tables below summarize 2009 EIA information on crude oil imports from Canada.<sup>3</sup> Data are shown for each refinery reporting on EIA-814.

For the 71 refineries importing Canadian crude oil in 2009, it is possible to determine volumes of heavy versus light Canadian crudes being processed by the refinery.<sup>4</sup> There are different conventions used to define heavy, medium, light, extra-heavy, etc. crude. For example, in California crude oil is considered heavy if it has an API gravity of 18° or lower. It is intermediate if it is greater than 18° and lower than 36°, and light if it is equal to or greater than 36°.<sup>5</sup> The U.S. Energy Information Administration defines heavy crude as having an API gravity of 22° or lower.<sup>6</sup> That is the definition that is used here.

From the information reported on EIA 814, we were able to generate a series of charts that show the following: 1) U.S. refineries that imported Canadian tar sands derived crude in 2009. These are refineries that reported imports of Canadian crude having an API gravity of 22° or lower; 2) U.S. refineries that likely imported Canadian tar sands derived crude in 2009. These are refineries that reported imports of Canadian crude with API gravities between 22° and 30°; and 3) U.S. refineries that did not import Canadian tar sands derived crude in 2009. These are refineries that reported imports of Canadian crude with an API gravity of 30° or higher, reported crude oil imports from countries other than Canada, or did not report crude oil shipments of any kind. Refineries that reported no crude oil shipments are marked with an asterisk (\*).

<sup>4</sup> There is not, however, a good source of comprehensive, up-to-date information on the refineries receiving blended bitumen and SCO from the tar sands. Up until now, we have primarily been relying on various industry and government reports to provide information on the names of the refineries processing Canadian blended bitumen E.g., TD Securities. Jan. 2004. *Overview of Canada's Oil Sands*; National Energy Board. 2004. *Canada's Oil Sands Opportunities and Challenges to 2015*.
